Lecture Overview

- C++ arrays

Declaring of C++ arrays

- A typical declaration for an array is:

type name [elements];

For example:

```
int grades[60]; // int array of 60 elements
```

Initializing C++ arrays

- When we declare array we can assign initial values to each element
- Enclose the values in braces { }

For example:

```
int quantity [5] = {10, 235, 77, 40, 12071};
```

Initializing C++ arrays

- Can leave the square brackets empty []
- Array size matches number of elements between { }

For example:

```
int quantity[] = {10, 235, 77, 40, 12071};
```

C++ arrays have index 0

	quantity
quantity[0]	10
quantity[1]	235
quantity[2]	77
quantity[3]	40
quantity[4]	12071

C++ arrays have index 0

	quantity
quantity[0]	10
quantity[1]	235
quantity[2]	77
quantity[3]	40
quantity[4]	12071

A=quantity [0];

After this
executes A
has value 10.

C++ arrays have index 0

	quantity
quantity[0]	10
quantity[1]	235
quantity[2]	77
quantity[3]	40
quantity[4]	12071

quantity [3] = 75;

After this
executes
quantity[3] will
have value 75.

C++ arrays have index 0

	quantity
quantity[0]	10
quantity[1]	235
quantity[2]	77
quantity[3]	75
quantity[4]	12071

Statement has
executed.

quantity [3] = 75;

Valid operations with arrays

- `quantity[0] = A;`
- `quantity[A] = 75;`
- `B = quantity[A+2];`
- `quantity[quantity[A]] = quantity[2] + 5;`

Simple Array Example

```
#include <iostream>
using namespace std;

int main()
{
    int quantity[] = {16, 2, 77, 40, 12071};
    int result = 0;
    for (int i = 0; i<5; i++) {
        result = result + quantity[i];
    }
    cout << result;
}
```

Multidimensional Arrays

- `type name [elements]...[elements];`

An example of a 5-dimensional array.

```
char century[100][365][24][60][60]
```

Multidimensional Arrays

- type name [elements]...[elements];

An example of a 2-dimensional array.

```
int scores[3][5];
```

	0	1	2	3	4
0					
1					
2					

Multidimensional Arrays

scores {

	0	1	2	3	4
0					
1					
2					

A 3x5 grid representing a 2D array. The columns are indexed 0 to 4 and the rows are indexed 0 to 2. The cell at row 1, column 3 is highlighted in light blue. A vertical double-headed arrow points to this cell from the text 'scores[1][3]' below.

scores[1][3]

Arrays as parameters

- When declaring a function must specify:
 - The element type
 - An array variable name
 - A pair of (empty) brackets

```
void procedure (int anArray[]) {  
    ...  
}
```

Arrays as parameters

- When declaring a function must specify:
 - The element type
 - An array variable name
 - A pair of (empty) brackets

```
void procedure (int anArray[]) {  
    ...  
}
```

element type

Arrays as parameters

- When declaring a function must specify:
 - The element type
 - An array variable name
 - A pair of (empty) brackets

```
void procedure (int anArray[]) {  
    ...  
}
```

Array variable name

Arrays as parameters

- When declaring a function must specify:
 - The element type
 - An array variable name
 - A pair of (empty) brackets

```
void procedure (int anArray[]) {  
    ...  
}
```

Pair of empty brackets

Example of Passing an Array

```
#include <iostream>
using namespace std;
int sumElements(int [], int);

int main()
{
    int quantity[] = {16, 2, 77, 40, 12071};
    int length = 5;
    int result = sumElements(quantity, length);
    cout << "Sum of Elements: " << result << endl;
}

// rest of program on next slide
```

Example of Passing an Array

```
int sumElements (int anArray[], int length) {  
    int sum = 0;  
    for (int j =0; j <length; j++) {  
        sum = sum + anArray[j];  
    }  
    return sum;  
}
```
