

## CISC106 Fall 2011 Lab09

- This lab and all subsequent labs will be due Sunday at 11:55 PM EDT on Sakai.
- The preparation problems below are to develop your understanding without creating extra work for you or the TA; these problems will not be graded. Be sure to read and understand them - they will help with the problems you must submit for grading
- Review the code examples from your notes in class.
- You may work with one or two other people on your lab (max size is three!). These people must be in your same lab section. If you do, **one** of you should be designated to submit the assignment on Sakai. **All of your names** should appear on code that you develop together<sup>1</sup>.
- Whom do you think deducts more points: a happy TA, or a frustrated TA? Make your work easy to read! It isn't just good software engineering, it is good for your grade!
- EVERY MATLAB program/function must include header, doc string that contains a human-readable description of what the function does, and must be followed by a good series of tests, as discussed in class. Always test boundaries. Do not test erroneous input (e.g. a factorial function does not need to correctly handle strings).
- EVERY .m file must have a comment line at the very top containing your name(s), lab section, and a brief description of what the file is.

### Preparation (do not submit for grading)

1. You can run MATLAB on Strauss by entering `matlab` at the command line. There may also be a shortcut in the start menu on the Sunrays in the lab. The MATLAB IDE will open up, and you'll have a shell that you can type code into in the middle window. MATLAB will load up any code in any files present in the directory you run it in.

### Programs (to be graded)

1. Download *sort\_timer.m* and *graph\_times.m* from the course web site. Open *sort\_timer.m* and notice that it's incredibly similar to the Python code you had in lab 08. Again, You should add functions for insertion sort and modify the timing function so that it times both merge sort and insertion sort. Make sure you set it up so it correctly returns a list with merge sort's steps and insertion sort's steps.
2. Now open *graph\_times.m*. Notice that it runs *sort\_timer* with list sizes from 100 to 1000 in increments of 100 (so you'll get the amount of steps to sort lists of size 100, 200, 300, ..., 1000.) Modify it so that it plots the trendlines for both merge sort and insertion sort. Take a screenshot of the graph that gets produced and submit it with your lab. **Hint:** To get both lines to plot on the same graph, you should give the `hold all` instruction between the two calls to `plot`.

You should submit your *sort\_timer.m*, *graph\_times.m*, the screenshot of the graph of the sort times and any other docs required by your TA on Sakai.

---

<sup>1</sup>If you would like to work with someone but don't know whom, your TA may be able to help connect you to other students looking for lab partners.
