

# Mechanisms and Manifestations of Disease Lecture 2

## Part 4 Alterations in Immunity

---

---

---

---

---

---

---

---

## Primary (Congenital) Immune Deficiencies

- Stem cell deficiency
  - ◆ Severe Combined Immunodeficiency Disease (SCID)
- Deficiencies in Antibody Production
  - ◆ IgA Deficiency
  - ◆ X-linked hypogammaglobulinemia

---

---

---

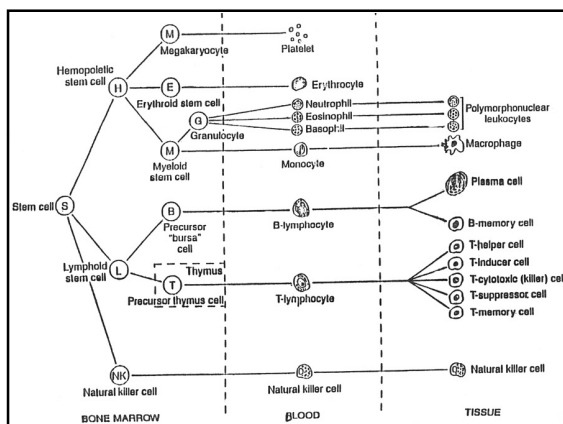

---

---

---

---

---

---

---

---

---

---

---

---

---

### Primary (Congenital) Immune Deficiencies (cont.)

- Deficiencies of cell-mediated immunity
  - ◆ DiGeorge Syndrome
- Complement Abnormalities

---

---

---

---

---

---

---

### Secondary (Acquired) Immune Deficiencies

- Multifactorial secondary immune deficiency
  - ◆ Stress
    - ◆ Considerable empirical evidence shows that stress suppresses the immune system
  - ◆ Psychosocial variables
  - ◆ Nutritional deficiencies

---

---

---

---

---

---

---

### Psychoneuroimmunology (PNI)

- The study of the physiologic processes underlying emotional impact upon the body
- The study of the relationship between emotional affect and health

---

---

---

---

---

---

---

## Physiological Effects of Stress

- Stressors may be events or anticipation of events with unfavorable implications
- Communication between endocrine, nervous, and immune system is through common mediators
  - ◆ Neurotransmitters
  - ◆ Hormones
  - ◆ Cytokines

## Neuroendocrine Stress Response

- Stressor perception and physiological activation occurs from complex feedback between cerebral cortex, limbic system, thalamus, hypothalamus, reticular formation, and reticular activating system

### Physiological Effects of Stress (cont.)

- In order to postulate that emotion influences health, a direct connection between the nervous system and immune system must be demonstrated

---

---

---

---

---

---

---

### Neuroimmune Connection

The modulation of immune function by neuropeptides may be an important physiological phenomenon

- ◆ suggests the link between behavior, disease development, and progression may exist on a cellular level
- ◆ may occur locally at nerve endings or distally through the circulatory system

---

---

---

---

---

---

---

### Neurological Cytokine Production

- Nervous system can secrete cytokines, the immune system activators

---

---

---

---

---

---

---

## Lymphocytes Produce Neurohormones

- ACTH, endorphins, thyrotropin, chorionic gonadotropin, growth hormone, somatostatin, luteinizing hormone

---

---

---

---

---

---

---

## Lymphocytes Have Receptors For:

- |                  |                                 |
|------------------|---------------------------------|
| ■ Substance P    | ■ Neurotensin                   |
| ■ Opiates        | ■ Somatostatin)                 |
| ■ Norepinephrine | ■ Vasoactive intestinal peptide |
| ■ Epinephrine    |                                 |
| ■ Bombesin       |                                 |

---

---

---

---

---

---

---

## Limbic System

- Limbic system may link the nervous and immune systems
  - ◆ Regulates visceral, affective, and cognitive behaviors
  - ◆ Controls CNS neurohormonal and autonomic outflow
  - ◆ Responds to peripheral endocrine signals
  - ◆ Responds to normal physiological signals from the immune system

---

---

---

---

---

---

---

## Pavlovian Conditioning

- Evidence for neuroimmune communication is through behavioral (pavlovian) conditioning of the immune responses

---

---

---

---

---

---

---

## Psychological Variables

---

---

---

---

---

---

---

## PNI Studies

- Studies relating psychological stress and NK down-regulation
  - ◆ Separation/divorce/marital discord studies
  - ◆ Bereavement studies
  - ◆ Depression studies
  - ◆ Stress reduction studies

---

---

---

---

---

---

---

Powerlessness

---

---

---

---

---

---

---

Mood/Affect

---

---

---

---

---

---

---

Nutrition

---

---

---

---
