

**NURS 821 Advanced  
Pathophysiology**

**Margaret H. Birney, PhD, RN**

**Lecture 5 Alterations in  
Blood Formation and  
Hemostasis**

---

---

---

---

---

---

---

**Alterations in Blood  
● Formation and  
Hemostasis**

Part 2 Alterations in Red Blood  
Cell Production

---

---

---

---

---

---

---

**● Increased RBC  
Production**

Polycythemias

---

---

---

---

---

---

---

## Polycythemia Effects

- Too many cells result in:
  - Increased blood volume
  - Increased blood viscosity

Clinical manifestations?

---

---

---

---

---

---

---

## Polycythemia

- Definition-many cells
- Types:
  - Relative
  - Absolute
    - Primary
    - Secondary

---

---

---

---

---

---

---

## Decreased Circulating RBCs-anemia

---

---

---

---

---

---

---

### **Anemia Definitions**

- Decreased numbers of circulating RBCs
- Decreased volume of packed RBCs to normal
- Decreased hemoglobin concentration

---

---

---

---

---

---

---

### **Anemia Classification**

- Etiology
- Morphology
  - Size (-cytic)-normo-, micro-, macro-
  - Color (-chromic)-normo-, hypo-

---

---

---

---

---

---

---

### **Compensatory Mechanisms and Clinical Manifestations**

- Decreased Hgb leads to decreased O<sub>2</sub> carrying capacity of blood
  - What compensatory mechanisms would the body employ?
  - What clinical manifestations would result?

---

---

---

---

---

---

---

### **Anemia Associated with Excess RBC Loss**

- Acute loss-normochromic normocytic
  - Clinical conditions
  - Manifestations
- Chronic loss-hypochromic, normocytic
  - Clinical conditions
  - Manifestations

---

---

---

---

---

---

---

### **Anemia of Chronic Disease: Etiology**

- Bone marrow depression
- Nutrient deficiencies
- Toxic environment
- Mechanical stress
- Conditions associated with secondary anemia:
  - TB
  - Lung abscess
  - Hepatic or renal failure
  - Bacterial endocarditis
  - Viral hepatitis
  - Some endocrine disorders

---

---

---

---

---

---

---

### **Anemias Caused by Decreased RBC Production**

---

---

---

---

---

---

---

## **Pernicious (Addison's) Anemia**

- Definition-megaloblastic anemia with anisocytosis and poikilocytosis
- Incidence-over age 60 of Northern European descent-Great Lakes region
- Etiology-IF deficiency; autoimmune or autosomal dominant

---

---

---

---

---

---

---

## **Pernicious Anemia (cont'd)**

- Pathophysiology
  - Vit. B12 deficiency results in failure of nuclear maturation of all cells, especially rapidly proliferating cells
- Clinical manifestations-anemia, neurological, GI

---

---

---

---

---

---

---

## **Folic Acid Deficiency Anemia**

- Definition-slowly progressive megaloblastic anemia
- Classification-macrocytic, normochromic
- Etiology
  - Populations at risk-
    - Pregnant women-decreased leads to birth defects
    - Infants
    - malnourished
- Clinical manifestations

---

---

---

---

---

---

---

## **Iron Deficiency Anemia**

- Classification-microcytic hypochromic anemia
- Incidence and populations at risk
- Etiology
  - Deficient dietary intake
  - Malabsorption syndromes
  - Chronic blood loss
- Pathophysiology
- Clinical manifestations

---

---

---

---

---

---

---

## **Aplastic (pancytopenia) Anemia**

- Classification-normocytic, normochromic
- Etiology-
  - Primary
  - Secondary-radiation, infection, chemicals, drugs, leukemia or lymphoma
- Pathophysiology-stem cell destruction in bone marrow
- Clinical manifestations

---

---

---

---

---

---

---
