

Z01ACFP

NAG Parallel Library Routine Document

Note: Before using this routine, please read the Users' Note for your implementation to check for implementation-dependent details.

1 Description

This function returns `.TRUE.` on the processor which is the root processor and `.FALSE.` otherwise. Output normally occurs through the root processor, so Z01ACFP is useful for identifying this processor (a formal definition of the root processor is given in the Essential Introduction). Z01ACFP may be called before Z01AAFP.

2 Specification

LOGICAL FUNCTION Z01ACFP()

3 Data Distribution

None.

4 Arguments

None.

5 Errors and Warnings

None.

6 Further Comments

None.
