### F11JDF - NAG Fortran Library Routine Document

Note. Before using this routine, please read the Users' Note for your implementation to check the interpretation of bold italicised terms and other implementation-dependent details.

# 1 Purpose

F11JDF solves a system of linear equations involving the preconditioning matrix corresponding to SSOR applied to a real sparse symmetric matrix, represented in symmetric coordinate storage format.

# 2 Specification

```
SUBROUTINE F11JDF(N, NNZ, A, IROW, ICOL, RDIAG, OMEGA, CHECK, Y,

X, IWORK, IFAIL)

INTEGER
N, NNZ, IROW(NNZ), ICOL(NNZ), IWORK(N+1), IFAIL

real
A(NNZ), RDIAG(N), OMEGA, Y(N), X(N)

CHARACTER*1
CHECK
```

# 3 Description

This routine solves a system of equations:

$$Mx = y$$

involving the preconditioning matrix:

$$M = \frac{1}{\omega(2-\omega)}(D+\omega L)D^{-1}(D+\omega L)^{T}$$

corresponding to symmetric successive-over-relaxation (SSOR) [1] on a linear system Ax = b, where A is a sparse symmetric matrix stored in symmetric coordinate storage (SCS) format (see Section 2.1.2 of the Chapter Introduction).

In the definition of M given above D is the diagonal part of A, L is the strictly lower triangular part of A, and  $\omega$  is a user-defined relaxation parameter.

It is envisaged that a common use of F11JDF will be to carry out the preconditioning step required in the application of F11GBF to sparse linear systems. For an illustration of this use of F11JDF see the example program given in Section 9.1. F11JDF is also used for this purpose by the black-box routine F11JEF.

# 5 Parameters

1: N — INTEGER

On entry: n, the order of the matrix A.

Constraint:  $N \geq 1$ .

2: NNZ — INTEGER

On entry: the number of non-zero elements in the lower triangular part of A.

Constraint:  $1 \leq NNZ \leq N \times (N+1)/2$ .

[NP3086/18/pdf] F11JDF.1

### 3: A(NNZ) - real array

Input

On entry: the non-zero elements in the lower triangular part of the matrix A, ordered by increasing row index, and by increasing column index within each row. Multiple entries for the same row and column indices are not permitted. The routine F11ZBF may be used to order the elements in this way.

4: IROW(NNZ) — INTEGER array

Input

5: ICOL(NNZ) — INTEGER array

Input

On entry: the row and column indices of the non-zero elements supplied in A.

Constraints: IROW and ICOL must satisfy the following constraints (which may be imposed by a call to F11ZBF):

 $1 \leq \text{IROW}(i) \leq N, 1 \leq \text{ICOL}(i) \leq \text{IROW}(i), \text{ for } i = 1, 2, \dots, \text{NNZ}.$ 

IROW(i-1) < IROW(i), or

IROW(i-1) = IROW(i) and ICOL(i-1) < ICOL(i), for i = 2, 3, ..., NNZ.

#### 6: RDIAG(N) - real array

Input

On entry: the elements of the diagonal matrix  $D^{-1}$ , where D is the diagonal part of A.

7: OMEGA — real

On entry: the relaxation parameter  $\omega$ .

Constraint:  $0.0 \le OMEGA \le 2.0$ .

#### 8: CHECK — CHARACTER\*1

Input

On entry: specifies whether or not the input data should be checked:

if CHECK = 'C', checks are carried out on the values of N, NNZ, IROW, ICOL and OMEGA; if CHECK = 'N', none of these checks are carried out.

See also Section 8.2.

Constraint: CHECK = 'C' or 'N'.

#### 9: $Y(N) - real \operatorname{array}$

Input

On entry: the right-hand side vector y.

### 10: $X(N) - real \operatorname{array}$

Output

On exit: the solution vector x.

11: IWORK(N+1) — INTEGER array

Work space

12: IFAIL — INTEGER

Input/Output

On entry: IFAIL must be set to 0, -1 or 1. For users not familiar with this parameter (described in Chapter P01) the recommended value is 0.

On exit: IFAIL = 0 unless the routine detects an error (see Section 6).

F11JDF.2 [NP3086/18/pdf]

# 6 Errors and Warnings

If on entry IFAIL = 0 or -1, explanatory error messages are output on the current error message unit (as defined by X04AAF).

Errors detected by the routine:

IFAIL = 1

On entry, CHECK  $\neq$  'C' or 'N'.

IFAIL = 2

On entry, N < 1,

or NNZ < 1,

or  $NNZ > N \times (N+1)/2$ ,

or OMEGA lies outside the interval [0.0,2.0],

IFAIL = 3

On entry, the arrays IROW and ICOL fail to satisfy the following constraints:

 $1 \leq \text{IROW}(i) \leq \text{N} \text{ and } 1 \leq \text{ICOL}(i) \leq \text{IROW}(i), \text{ for } i = 1, 2, \dots, \text{NNZ}.$ 

IROW(i-1) < IROW(i), or

IROW(i-1) = IROW(i) and ICOL(i-1) < ICOL(i), for i = 2, 3, ..., NNZ.

Therefore a non-zero element has been supplied which does not lie in the lower triangular part of A, is out of order, or has duplicate row and column indices. Call F11ZBF to reorder and sum or remove duplicates.

# 7 Accuracy

The computed solution x is the exact solution of a perturbed system of equations  $(M + \delta M)x = y$ , where

$$|\delta M| \le c(n)\epsilon |D + \omega L||D^{-1}||(D + \omega L)^T|,$$

c(n) is a modest linear function of n, and  $\epsilon$  is the **machine precision**.

## 8 Further Comments

#### 8.1 Timing

The time taken for a call to F11JDF is proportional to NNZ.

#### 8.2 Use of CHECK

It is expected that a common use of F11JDF will be to carry out the preconditioning step required in the application of F11GBF to sparse symmetric linear systems. In this situation F11JDF is likely to be called many times with the same matrix M. In the interests of both reliability and efficiency, you are recommended to set CHECK to 'C' for the first of such calls, and to 'N' for all subsequent calls.

# 9 Example

This example program solves a sparse symmetric linear system of equations:

$$Ax = b$$
,

using the conjugate-gradient (CG) method with SSOR preconditioning.

The CG algorithm itself is implemented by the reverse communication routine F11GBF, which returns repeatedly to the calling program with various values of the parameter IREVCM. This parameter indicates the action to be taken by the calling program.

[NP3086/18/pdf] F11JDF.3

If IREVCM = 1 a matrix-vector product v = Au is required. This is implemented by a call to F11XEF

If IREVCM = 2 a solution of the preconditioning equation Mv = u is required. This is achieved by a call to F11JDF.

If IREVCM = 4 F11GBF has completed its tasks. Either the iteration has terminated, or an error condition has arisen.

For further details see the routine document for F11GBF.

### 9.1 Program Text

**Note.** The listing of the example program presented below uses bold italicised terms to denote precision-dependent details. Please read the Users' Note for your implementation to check the interpretation of these terms. As explained in the Essential Introduction to this manual, the results produced may not be identical for all implementations.
