2009

Social Class Disparities in Health: A Vexing Puzzle with a Surprising Answer?

Linda S. Gottfredson, Professor
University of Delaware

August 7, 2009

Presentation to accept 2008 George A. Miller Award for outstanding article across specialty areas, Division 1, APA

American Psychological Association

Agenda

1. What are “disparities”?
2. What’s the vexing puzzle?
3. Is human cognitive diversity key to solving it?
4. If yes, so what?

Answers: All surprising

Agenda

1. What are “disparities”?

Examples

2. Why such a vexing puzzle?
3. Is human cognitive diversity the key to solving it?
4. If yes, so what?

“Disparity” = group differences on health outcome X

“Explaining” between-group variation

Typical indicators of socioeconomic status (SES)

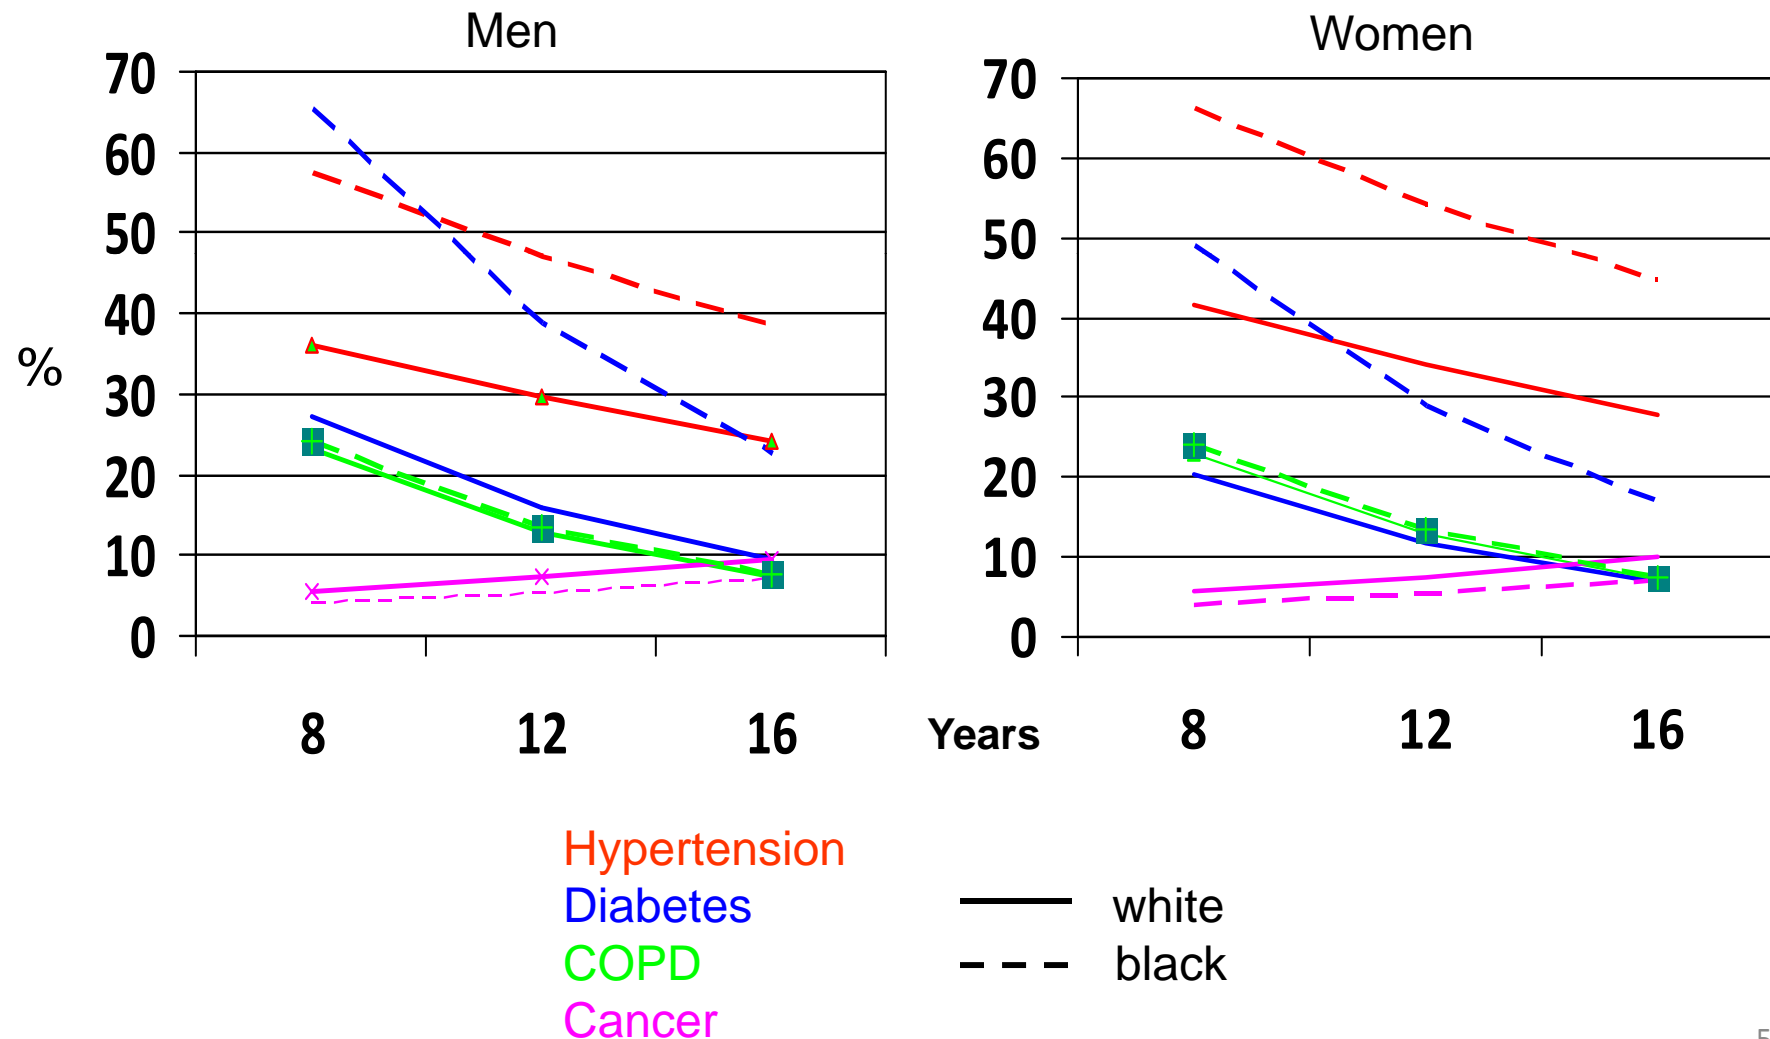

- Years education
- Occupational status
- Income

But not clear what they really represent or have in common

Typical health disparities by education; in all races & sexes: % of non-ill 51-year-olds expected to have this chronic illness by age 63

(Hayward et al, 2000)

Typical health disparities by education; in all races & sexes: % of non-ill 51-year-olds expected to have this chronic illness by age 63

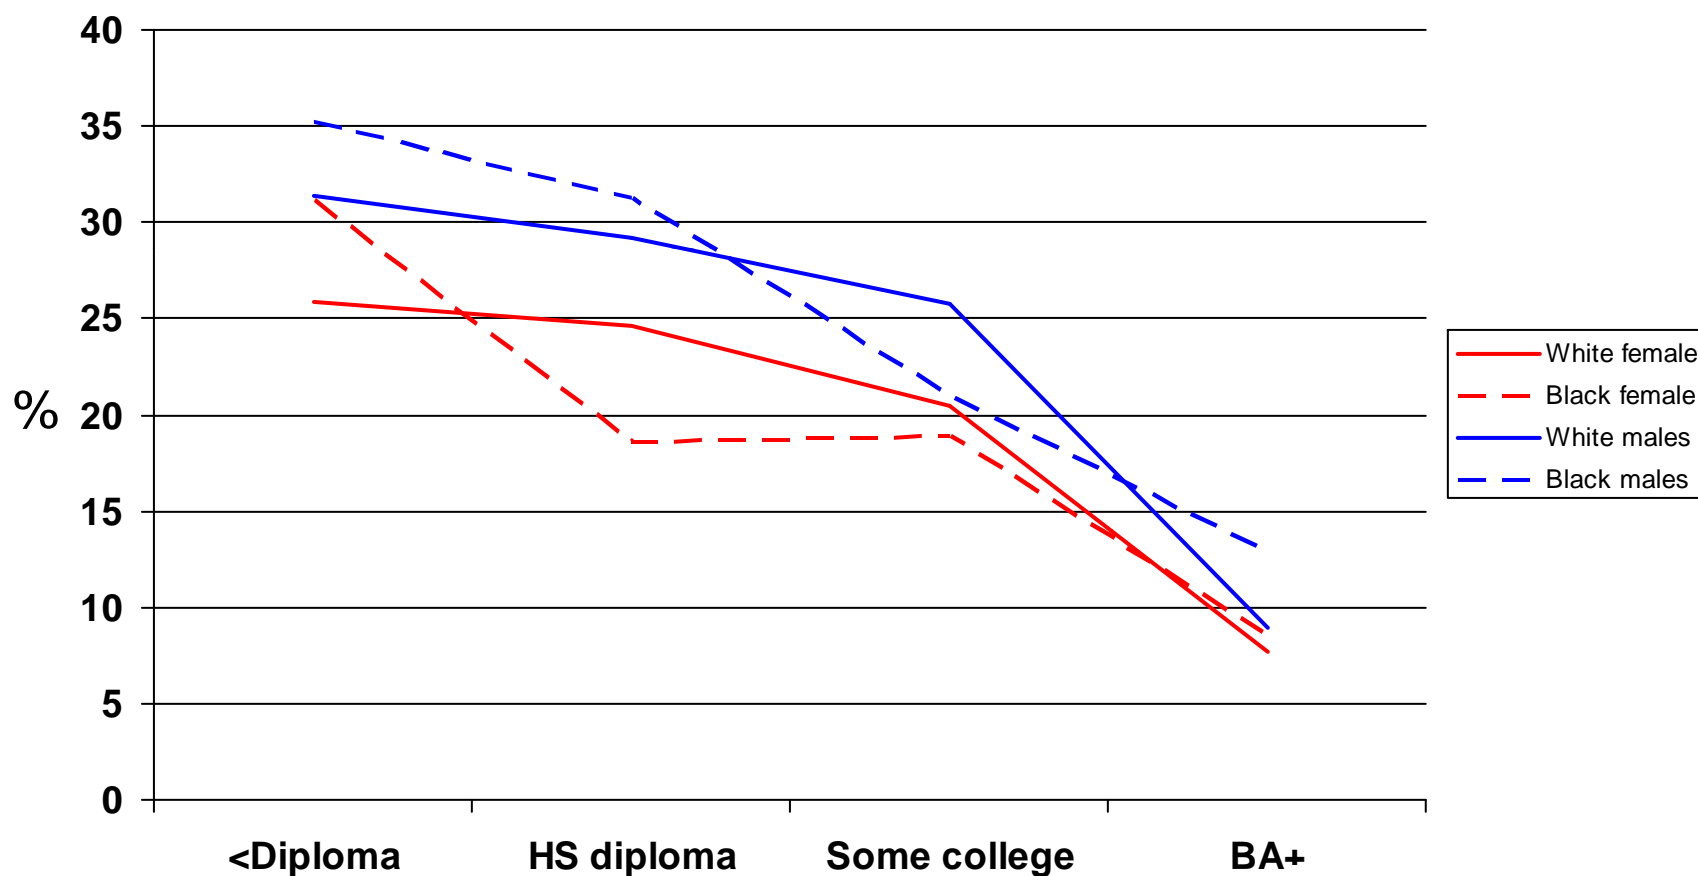

(Hayward et al, 2000)

- Fewer health problems in higher social classes (educ, occup, or \$)
- True for all races, sexes
- Exceptions are rare (e.g., cancer morbidity)

Disparities in health behavior by education; all races & sexes:

% who smoke, 2006 (age adjusted)
(CDC, Health in the United States, 2008, Table 64)

Typical course of behavior disparities over time, by education:

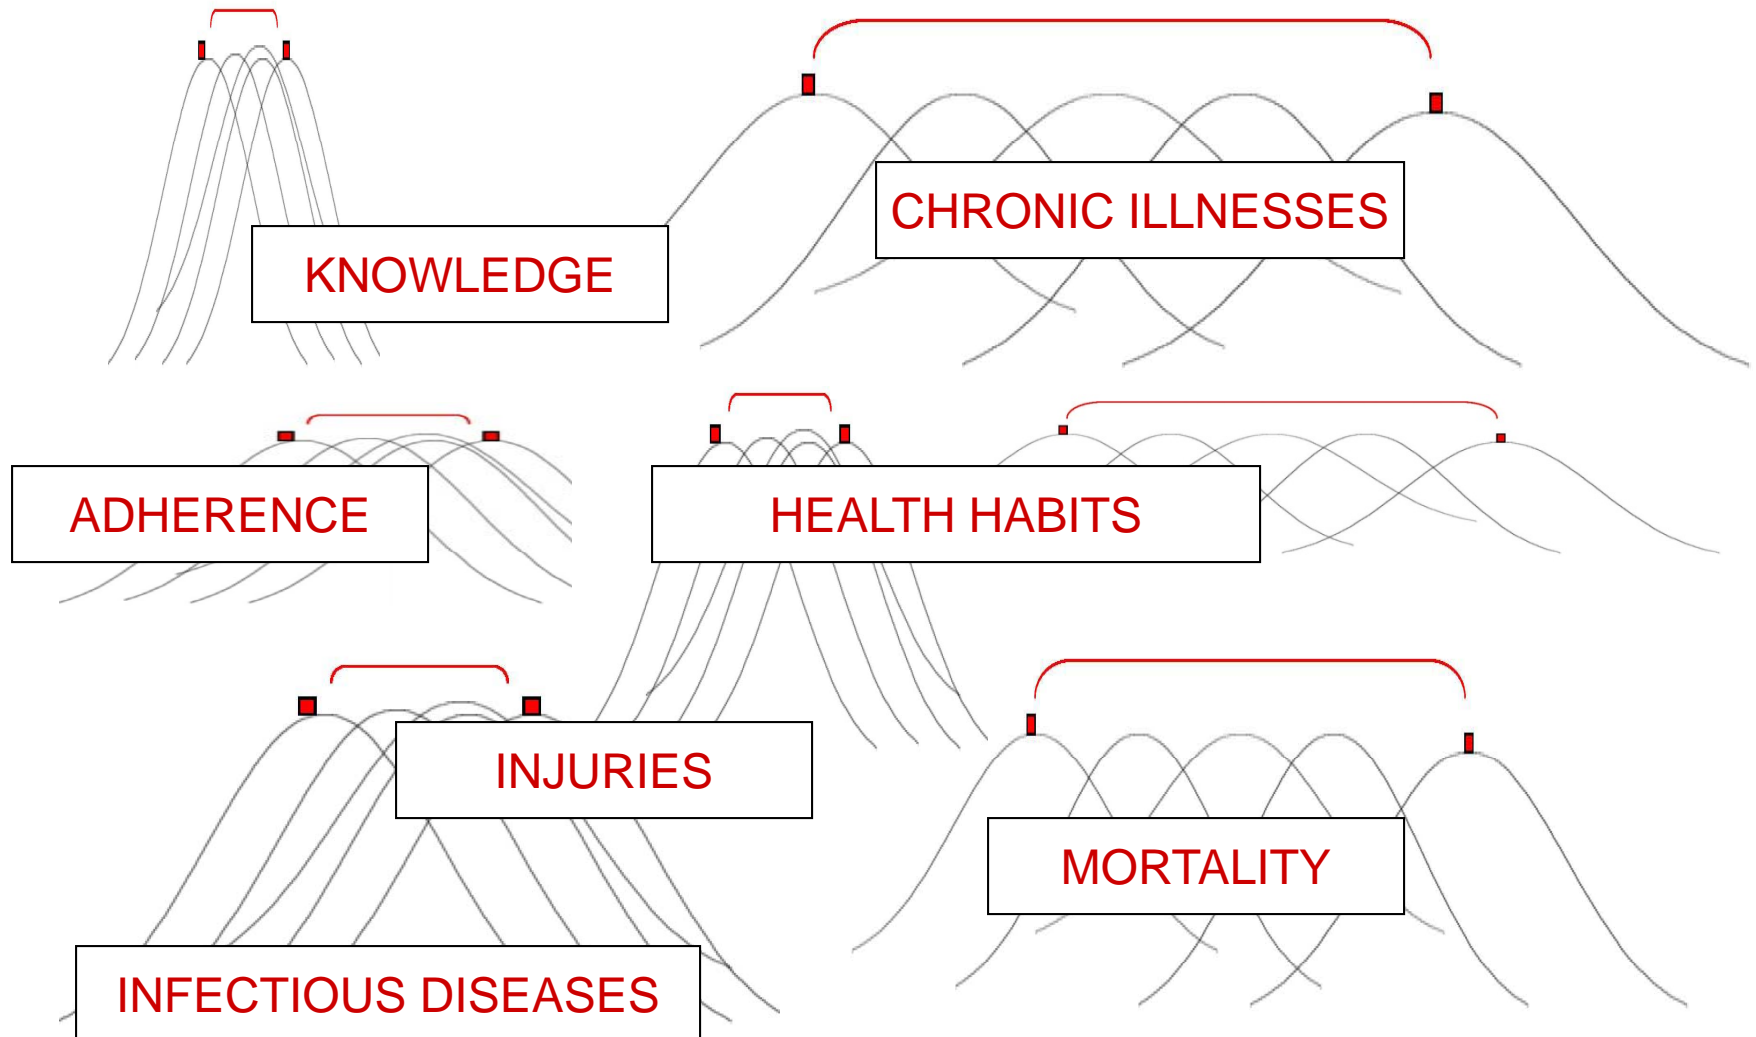

% who smoke, 1974-2006, ages 25+ (age-adjusted)

(CDC, Health in the United States, 2008, Table 64)

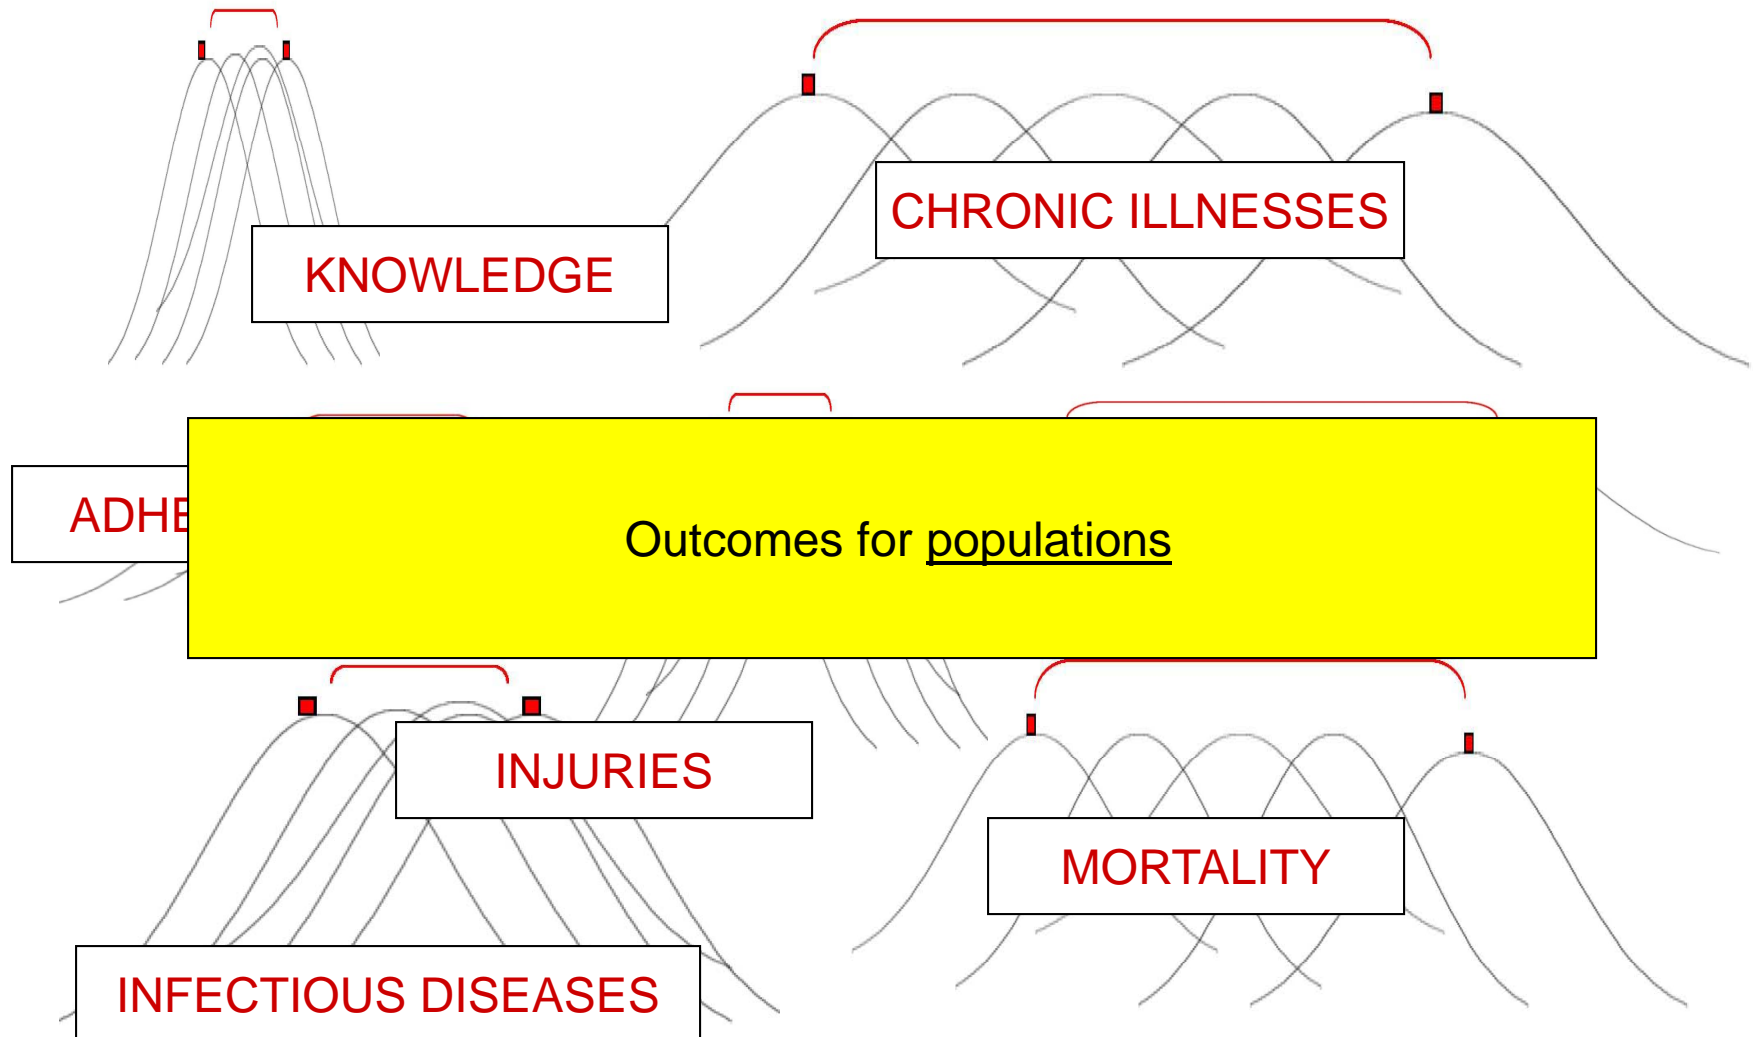

% better, gap bigger

Many families of health disparities

Many families of health disparities

This is **not** about individual differences in health outcomes

Not “explaining” within-group variation

Within-group and between-group variance may arise from different mix of causes
Often misunderstood!

Study of populations aided by epidemiological approach

- Outcomes
 - Means, rates, relative risk, odds ratios for groups
- Predictors—classic trio
 - Exposure to hazards, help (probability) ✕
 - Host (susceptibility) ←
 - Vector (virulence, burden) ●

Study of populations aided by epidemiological approach

- Outcomes
 - Means, rates, relative risk, odds ratios for groups
- Predictors—classic trio
 - Exposure (probability) Current focus of SES disparities research
 - Host (susceptibility)
 - Vector (virulence, burden)

Missing 2/3

Agenda

1. What are “disparities”?

2. **Why such a vexing puzzle?**

But first, what exactly are we trying to explain?

➤ **Statistically**

Illustration

• **Substantively**

3. Is human cognitive diversity the key to solving it?

4. If yes, so what?

Illustration with 2 disparities

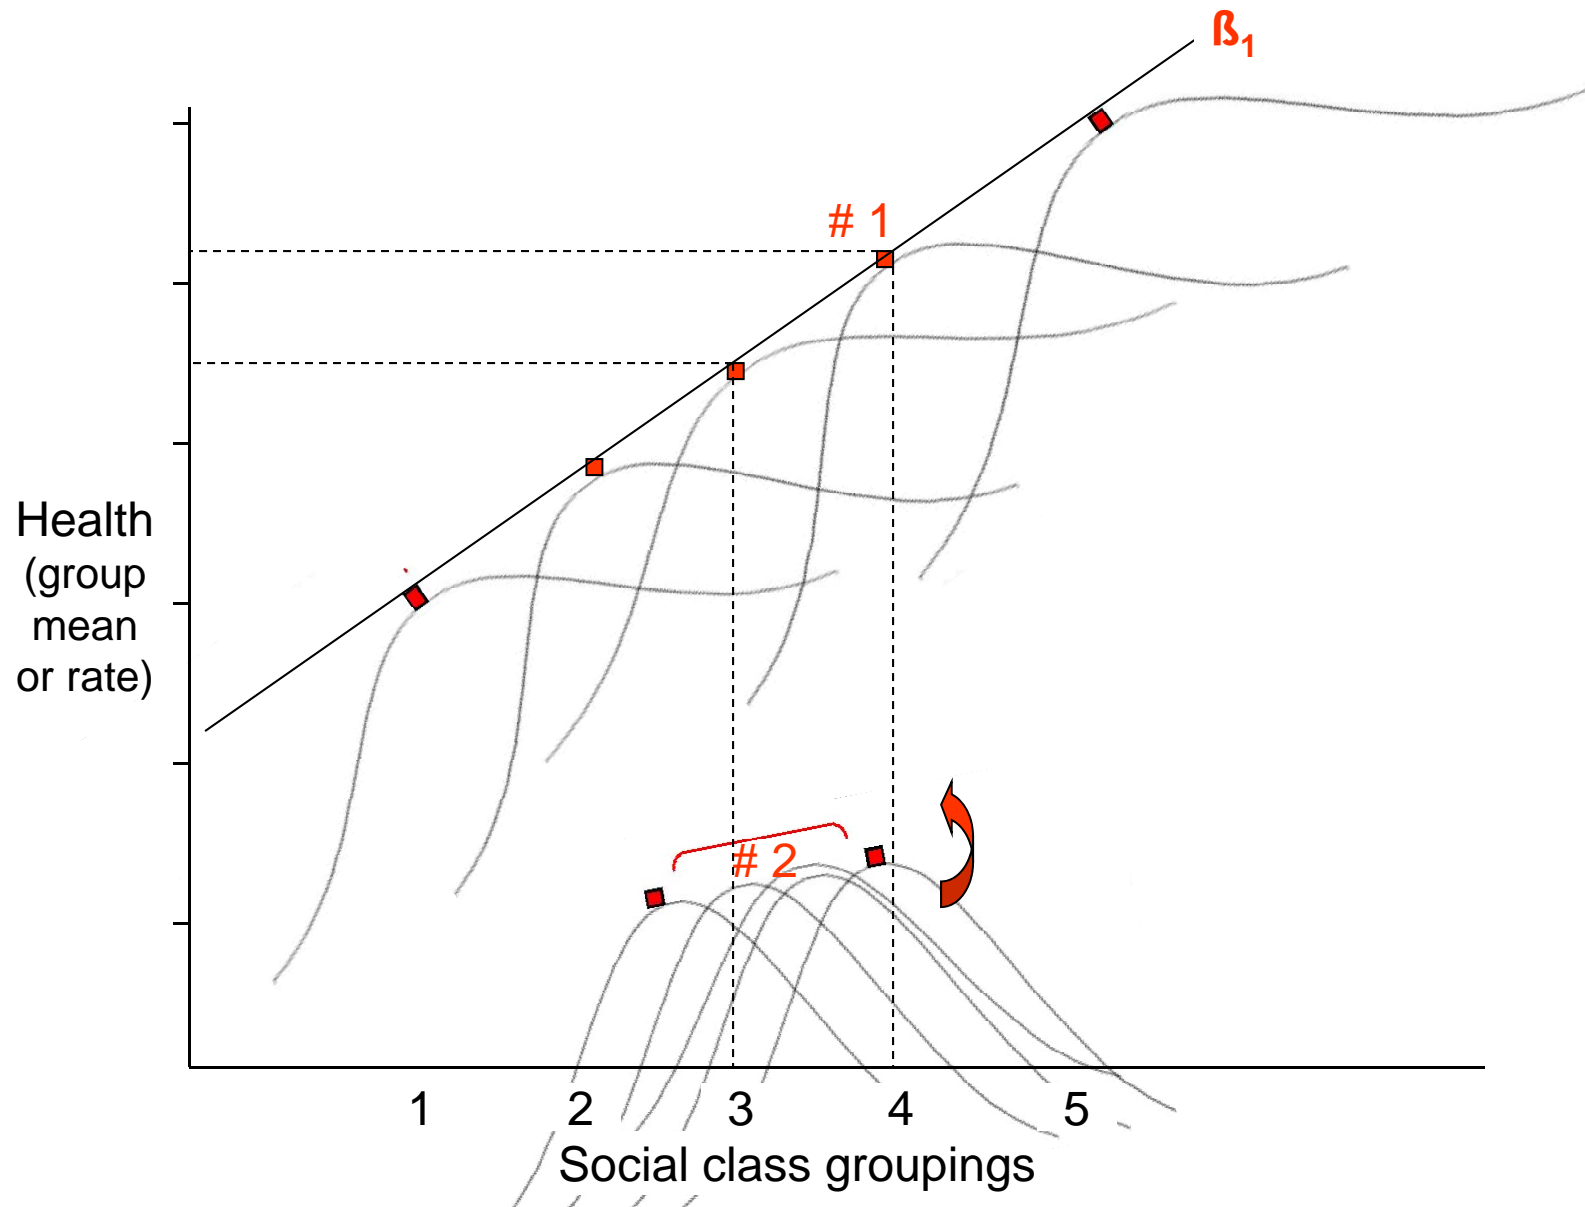

Statistically...

Each disparity is a gradient, with a slope (β)

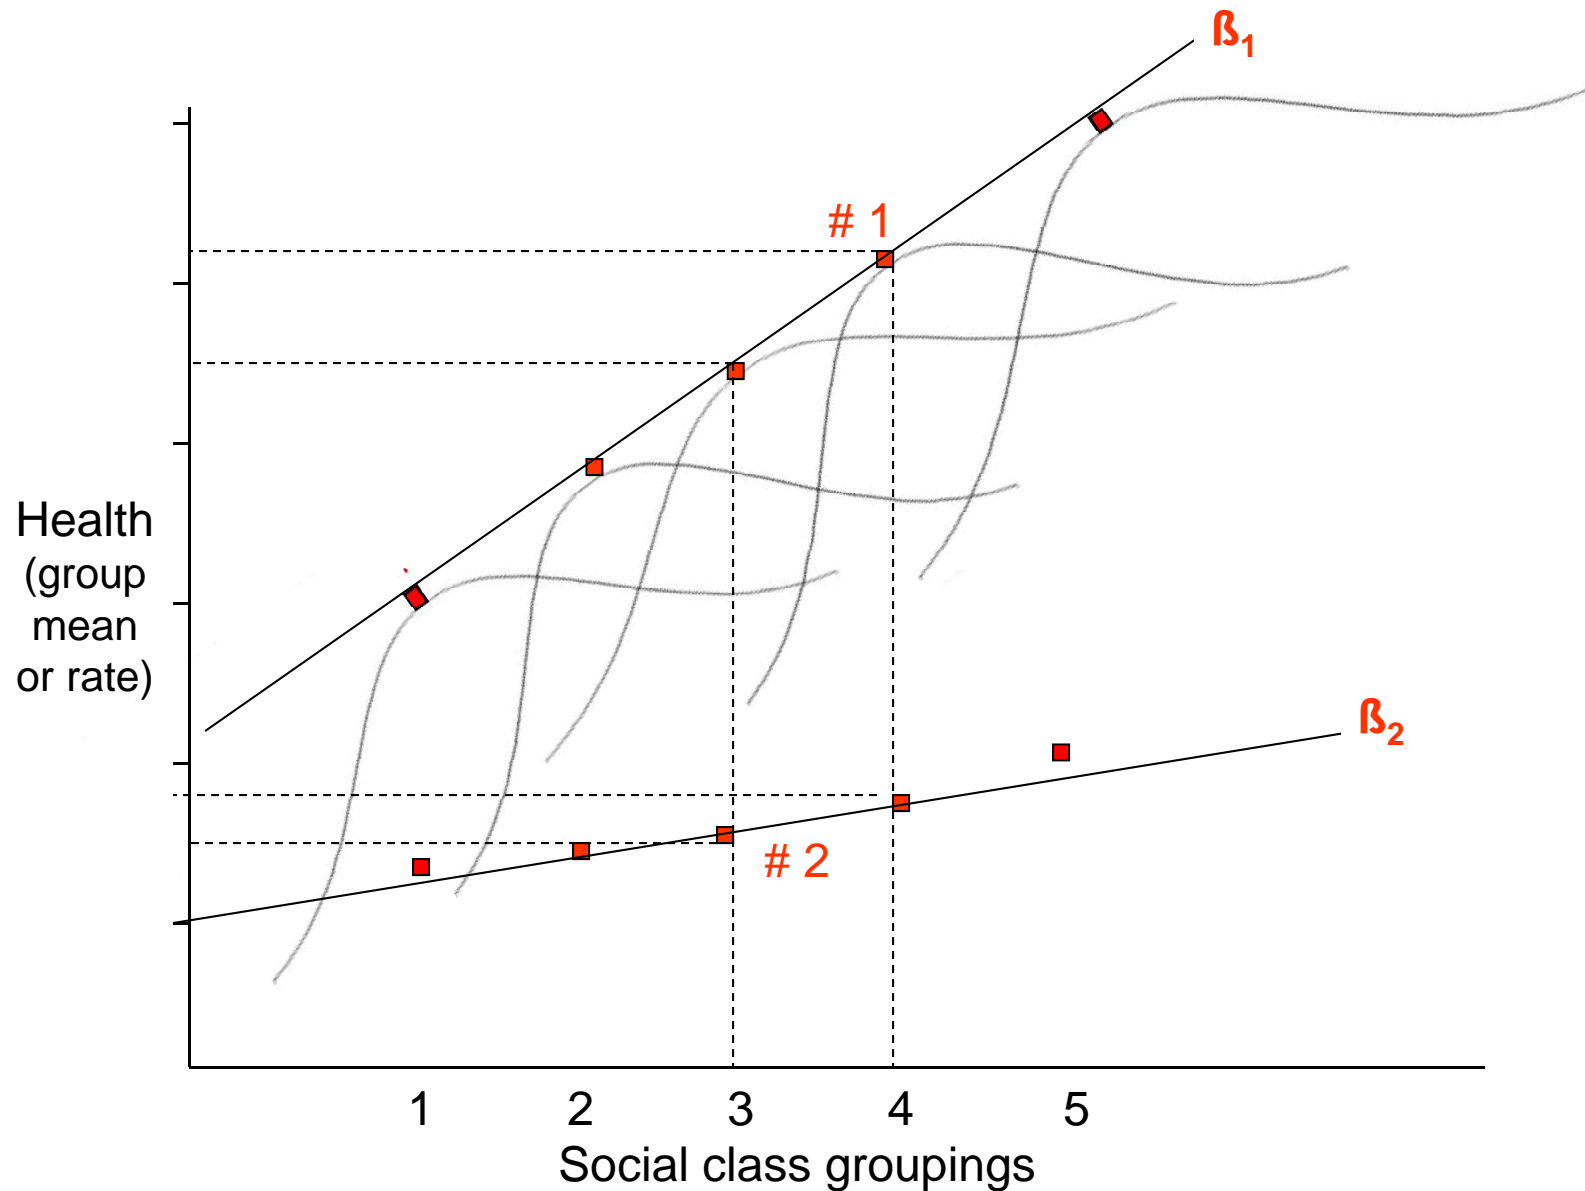

Statistically...

Each disparity is a gradient, with a slope

Statistically...

Each disparity is a gradient, with a slope

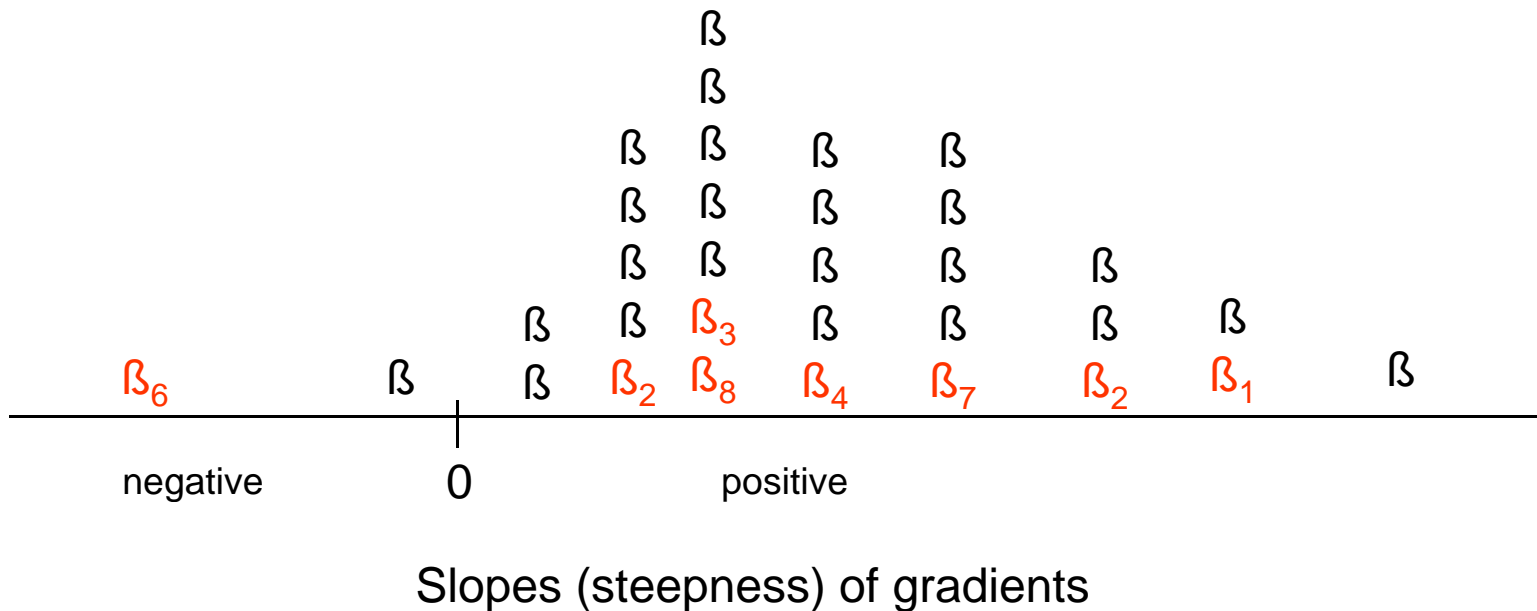

Many families of health gradients (slopes):

Morbidity, mortality, knowledge, prevention, adherence, etc.

So, to explain SES disparities:
Explain the distribution of co-evolving gradients
(β , their standardized slopes)

Common policy goal : All $\beta = 0$

Agenda

1. What are “disparities”?

2. **Why such a vexing puzzle?**

But first, what exactly are we trying to explain?

- Statistically

- **Substantively**

Examples

3. Is human cognitive diversity the key to solving it?

4. If yes, so what?

General puzzle: Health disparities are *too* general for SES mechanisms to explain

They are pervasive, persistent and monotonic regardless of time, place, health system, disease, and behavior. Why??

Exposure hypothesis 1:
“Wealth = health” (can afford good care)

**REJECTED—
puzzle greater!**

Experimental test of exposure hypothesis 1:

Equalize access to care ➡ equalize health

- Time 1: Unequal access

FAILED—Puzzle greater!

- Time 2: After equal access (free care)

E.g., UK in 1950s

Health disparities *grow*, not shrink

Experimental test of exposure hypothesis 2: Unequal education ➡ unequal health

- Time 1: Unequal knowledge of

**FAILED—Puzzle
greater!**

- Time 2: After public health campaign

Knowledge disparities *grow*, not shrink

Or disparities even reverse direction with new screening tests (e.g., death rates from breast cancer)

- Negative disparities for Outcome X at Time 1

More educated women have higher death rates

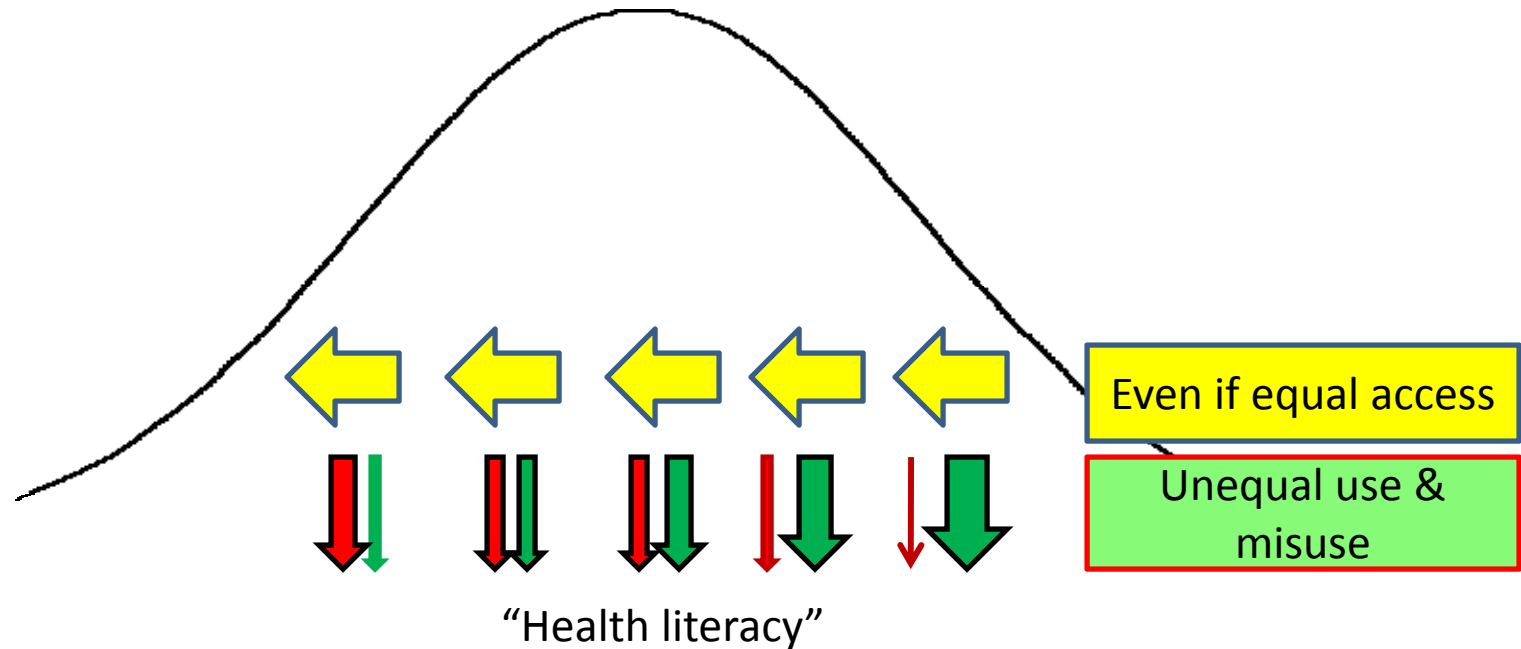

- Positive disparities for Outcome X at Time 2

Access matters, but so does utilization

- Mammograms
- Adherence to treatment
- Seat belt use
- Etc.

Summary of puzzle

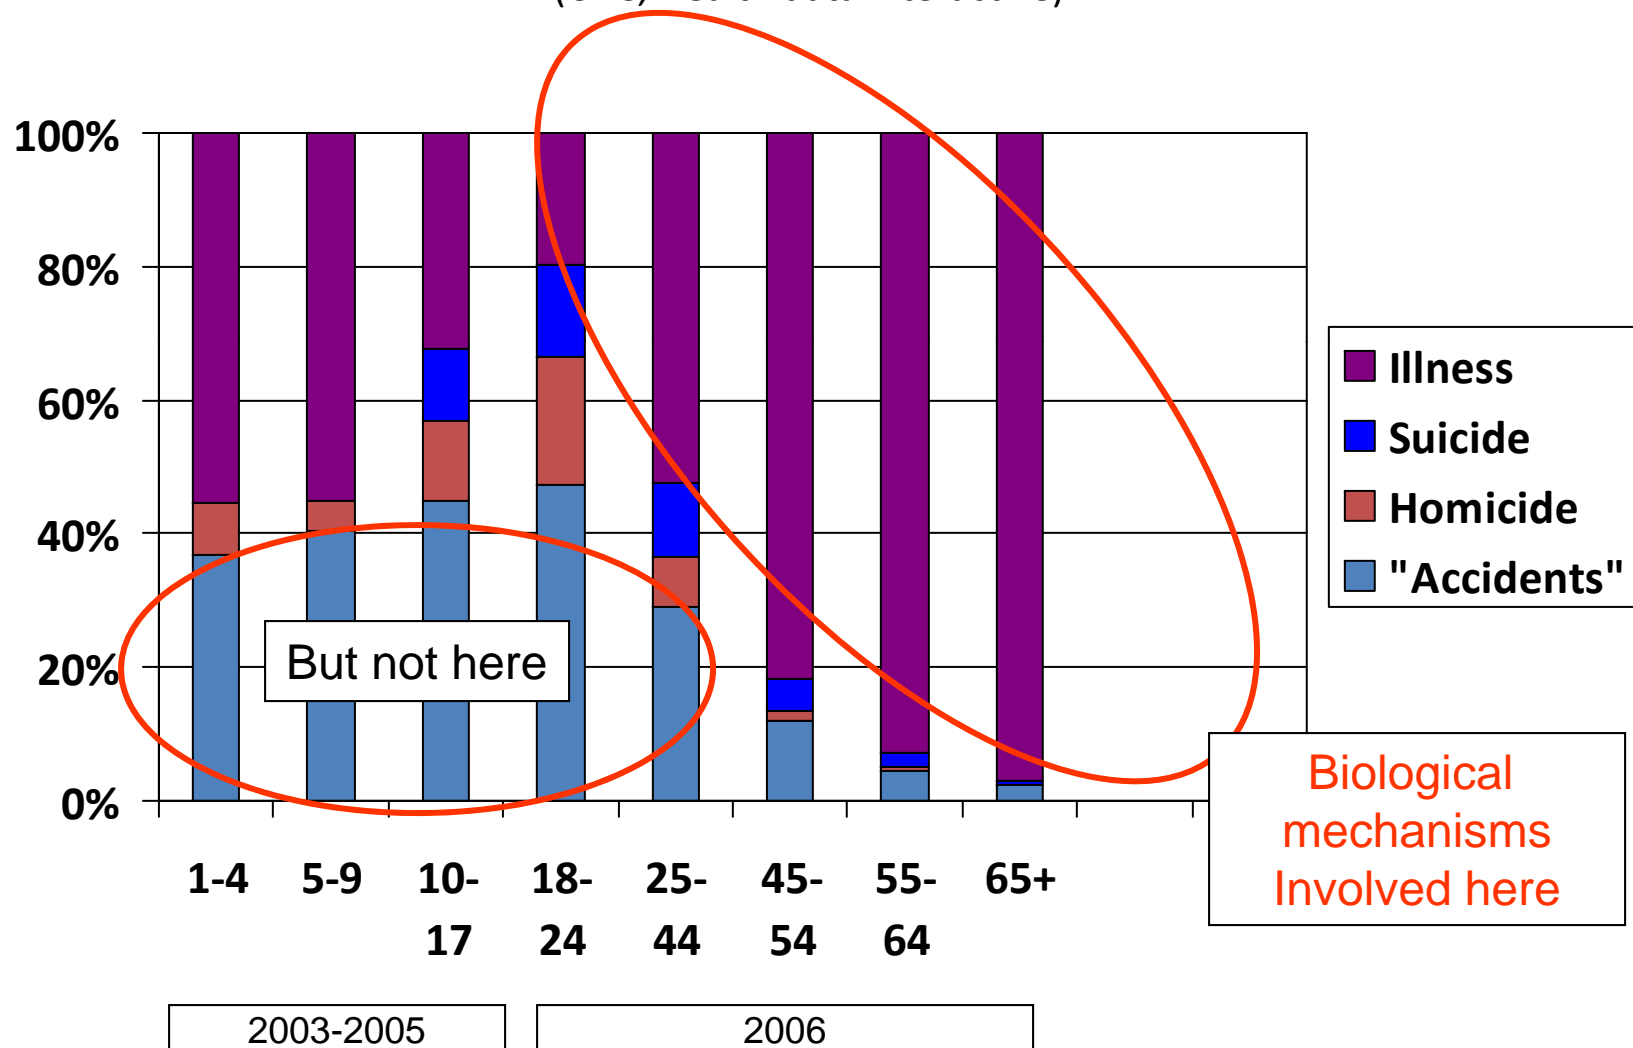

So, the field seeking more “fundamental cause” of SES disparities

- This cause must:
 - o be pervasive & domain-general
 - o have linear (monotonic) effects
 - o not be material
- Most popular suspect = inequality itself
 - o relative deprivation ➡ chronic psychological stress
 - ➡ damaging physiological process: **“allostatic load”**
- Stress important, but can’t explain:
 - o why adding resources *increases* disparities
 - o disparities in non-biological outcomes

First, physical illness is only one cause of injury & death:

Causes of death, males by age

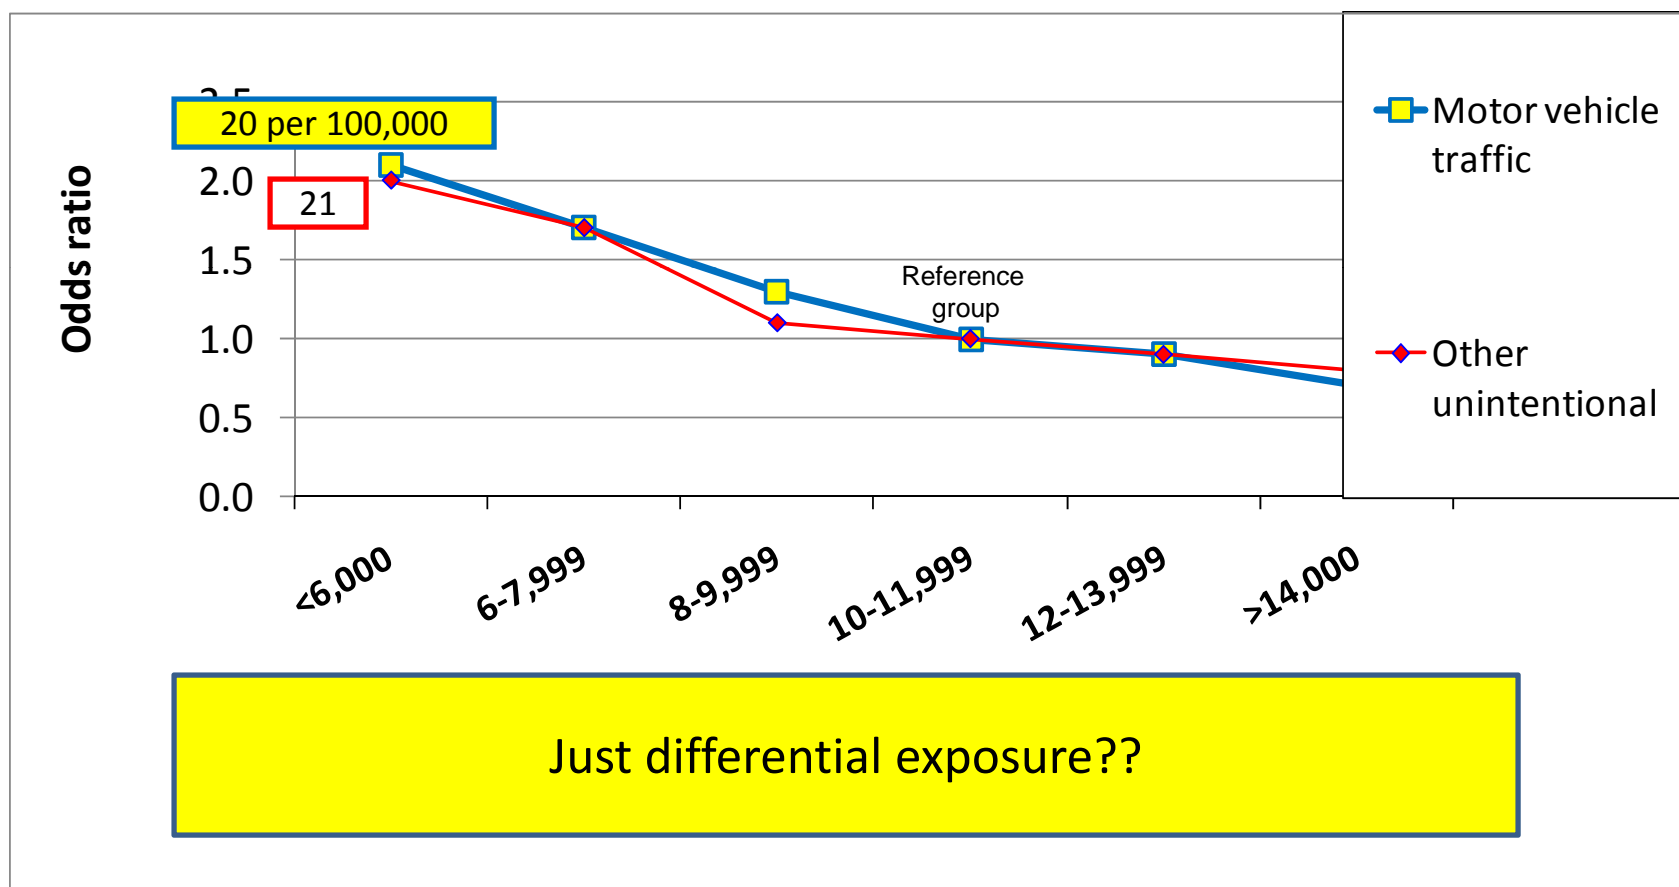

(CDC, Health data interactive)

Common theme—all are preventable

Example: Unintentional (“accidental”) death

Odds ratios by neighborhood income (1980-86)

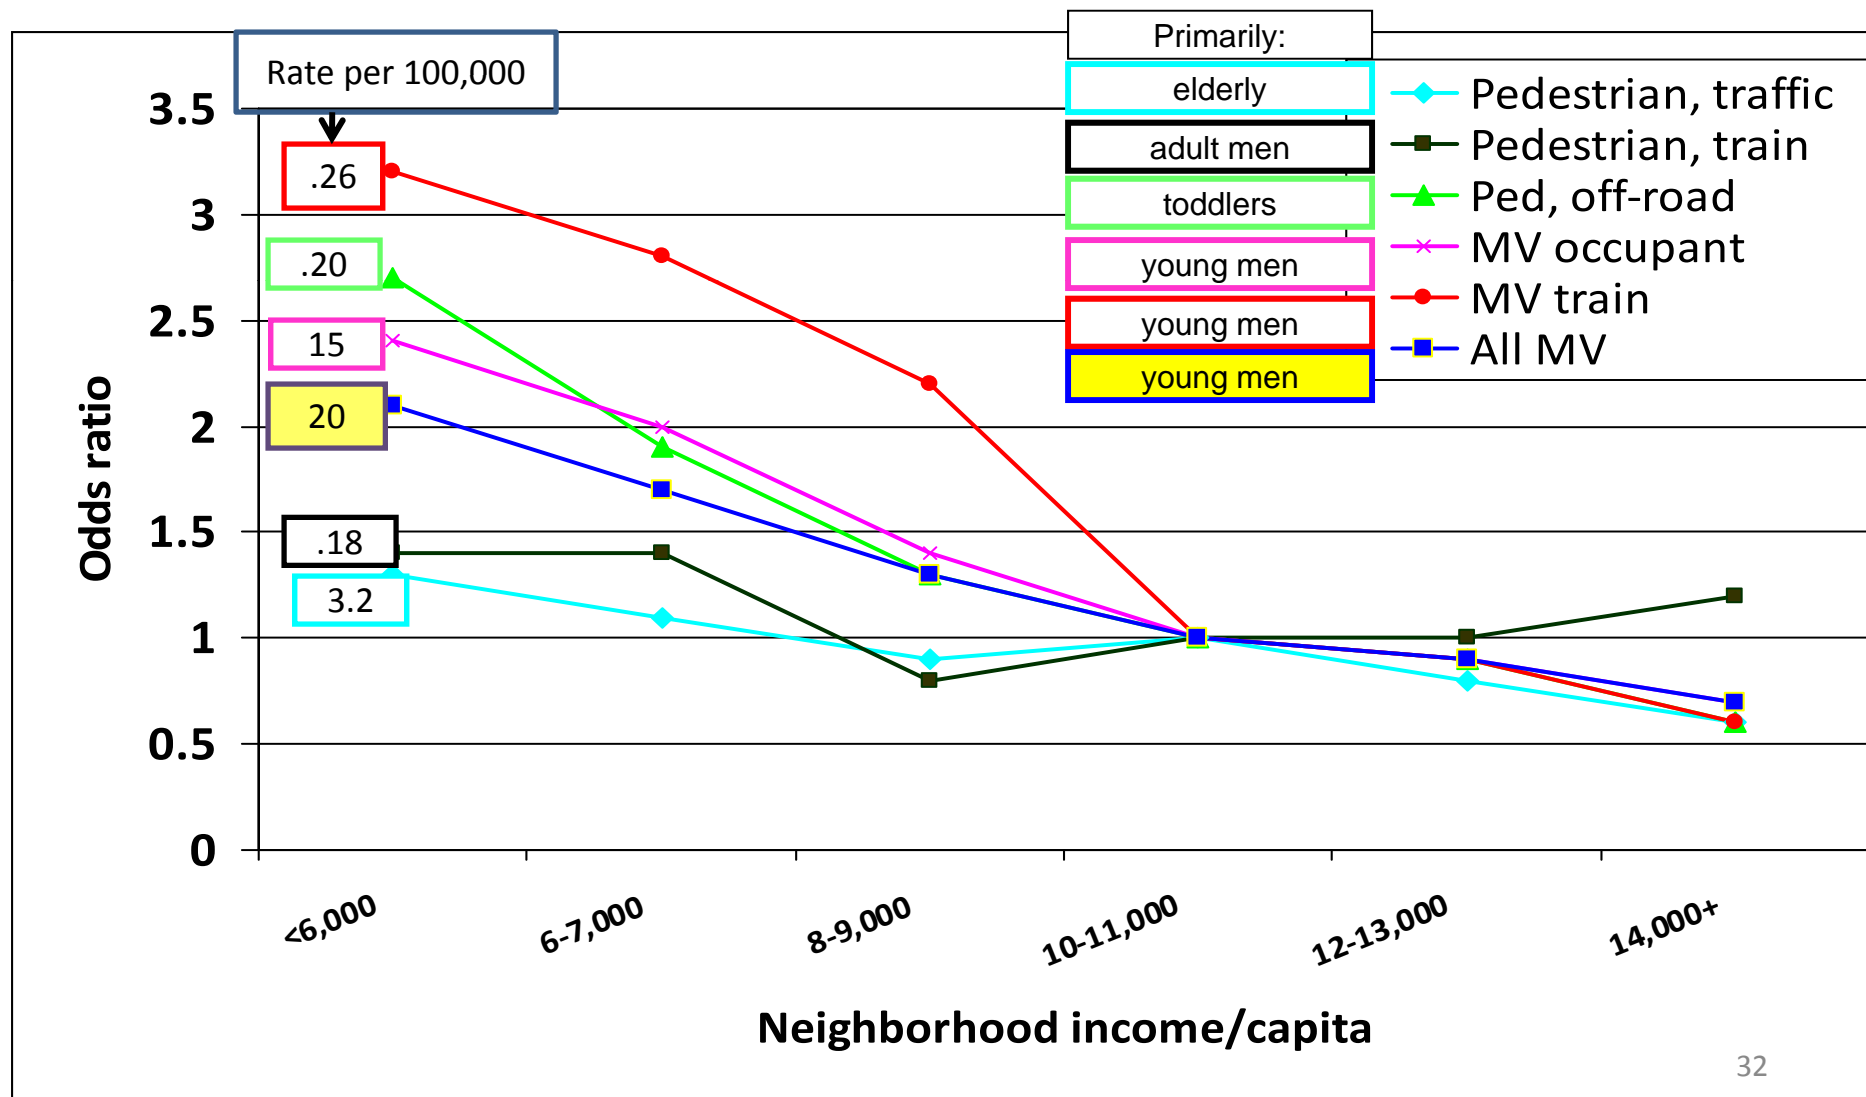

$$\text{Odds} = \frac{\% \text{ affected}}{\% \text{ not}}$$

$$\text{Odds ratio} = \frac{\text{Odds for Group 1}}{\text{Odds for reference group}}$$

Selected causes of “motor vehicle traffic” death, by neighborhood income/capita (1980-86)

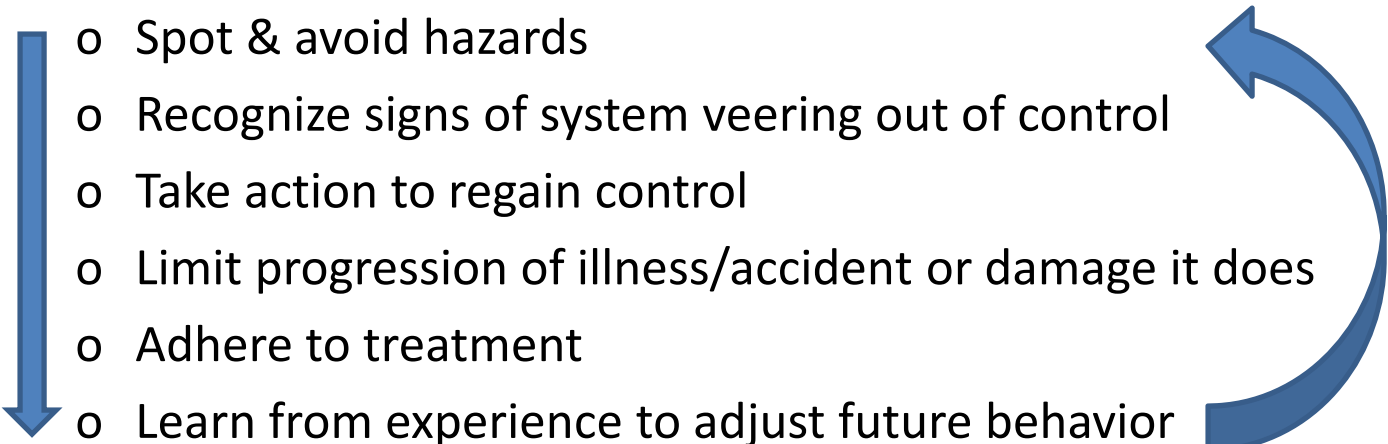

(Baker, O’Neill, Ginsburg, & Li, 1992)

(Baker, O'Neill, Ginsburg, & Li, 1992)

The common mechanism for illness and injury?

- Prevention
 - o It's our job
 - o It's daily, unrelenting, life-long (hazards are everywhere)
 - o It's complex
 - It's a highly cognitive, multi-step, active process
 - o Spot & avoid hazards
 - o Recognize signs of system veering out of control
 - o Take action to regain control
 - o Limit progression of illness/accident or damage it does
 - o Adhere to treatment
 - o Learn from experience to adjust future behavior
- 

Passive-patient model is dead wrong

Agenda

1. What are “disparities”?
2. Why such a vexing puzzle?
- 3. Is human cognitive diversity the key?**
4. If yes, so what?

IQ/g

Alternative hypothesis for disparities in health:

“Intelligence (g) differences are the
“fundamental cause”

Two g -based levers ratchet up gradients*

- Bigger IQ differences (people) → susceptibility
- Heavier cognitive load (tasks) → burden

* Based on extensive research in education & employment

Translated: A hypothesis about gradients

Background fact #1

Great cognitive diversity is a biological fact about all populations

Background fact #2

$IQ \approx g$ (general mental ability factor)

- g is no longer a black box

Background fact #2

$IQ \approx g$ (general mental ability factor)

- g is no longer a black box
- g is a domain-general facility for learning, reasoning, spotting & solving novel problems
 - o Higher g reduces susceptibility to error
 - o Gives bigger edge as task complexity (cognitive load) increases
 - o Allows one to exploit resources more fully & effectively (e.g., classroom instruction, medical treatments)

Gives an edge in planning; anticipating problems

"Shhhh, Zog! ... Here come one now!"

Background fact #3

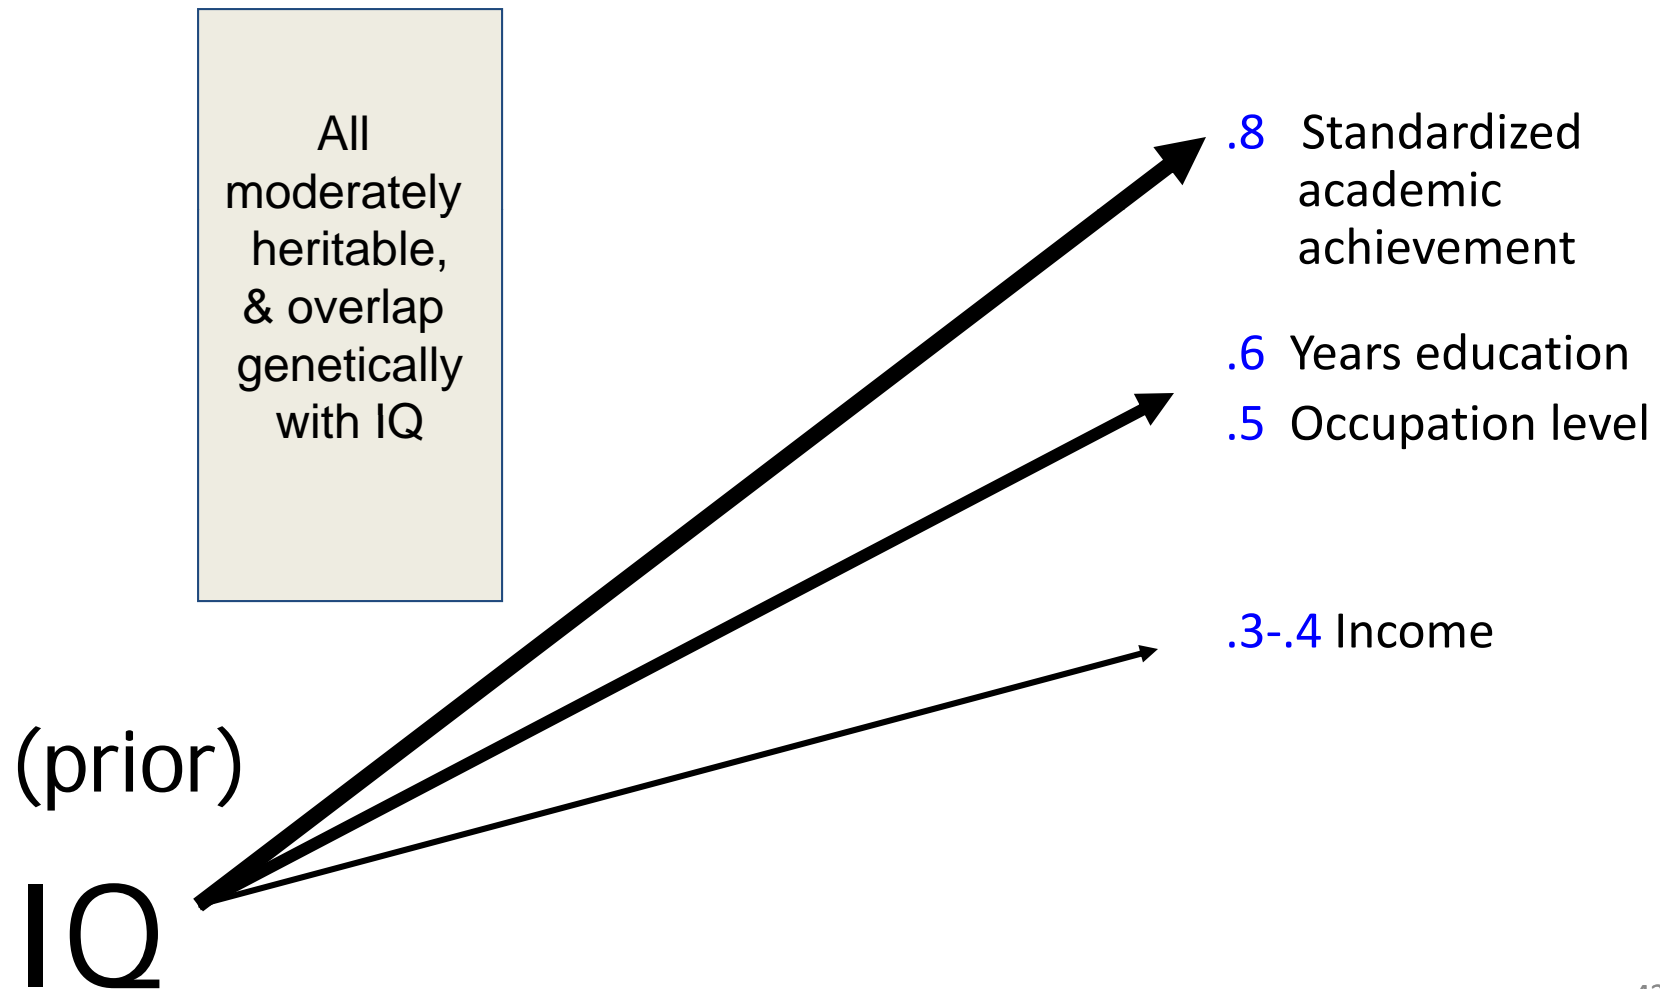

Mean IQs differ by occupation level and years education

WAIS-R IQ (mean \pm 1 SD), US adults ages 16-74

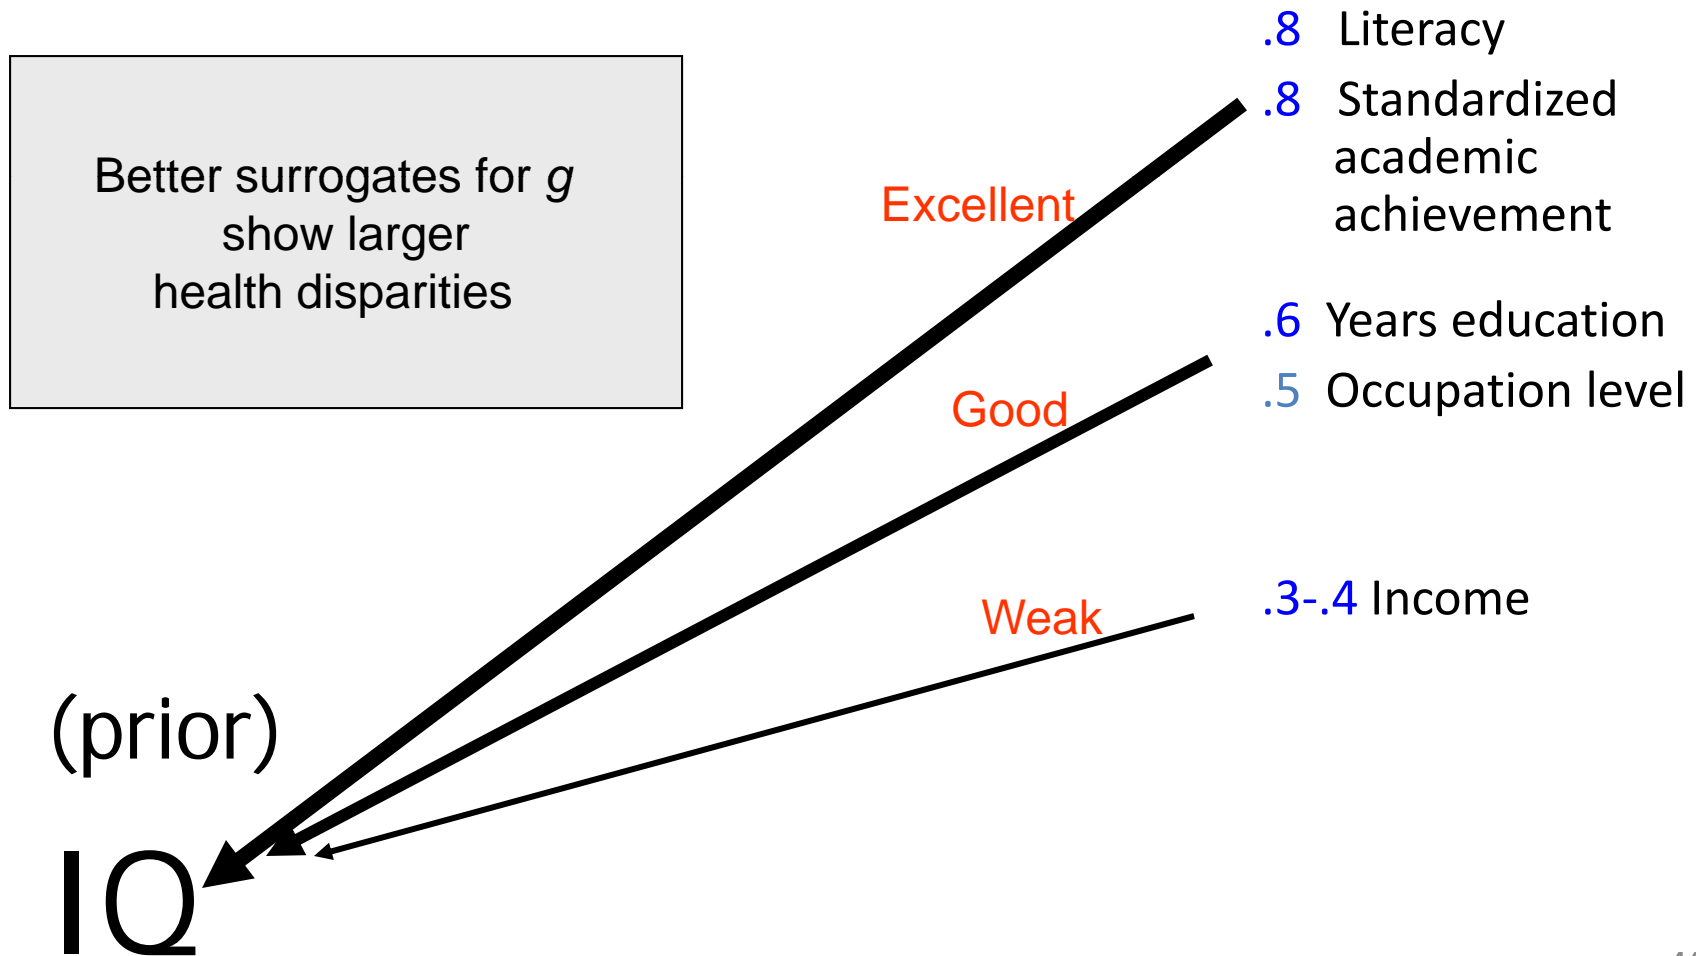

Background fact #4:

Some SES indicators correlate more with IQ

Background fact #4:

Conversely, some are better surrogates for IQ

Better
surrogates
for g show
larger
health
disparities
(steeper
gradients)

income

occupation

education

“literacy”

Background fact #4:

Cannot “control” for SES without
controlling away much of (genetic) g itself

Background fact #5:

Task complexity increases gaps in performance

- Gaps small when learning & reasoning demands are light

- Gaps large when learning & reasoning demands are heavy

Common in schools & jobs

Background fact #5:

Task complexity increases gaps in performance

- Gaps small when learning & reasoning demands are light

- Gaps large when learning & reasoning demands are heavy

Cognitive load brings out differences in cognitive susceptibility

New technologies make life increasingly complex, which puts yet higher premium on *g*

Preventive & curative care becoming increasing complex

Background fact #6:

People differ more than often assumed

U.S. Dept of Education 1993 survey of adult functional literacy
(nationally representative sample, ages 16+, N=26,091)

NALS Level	% pop.	Simulated Everyday Tasks <i>Routinely able to perform tasks only up to this level of difficulty</i>
5	3%	<ul style="list-style-type: none">• Use calculator to determine cost of carpet for a room• Use table of information to compare 2 credit cards
4	17%	<ul style="list-style-type: none">• Use eligibility pamphlet to calculate SSI benefits• Explain difference between 2 types of employee benefits

On Saturday afternoon, if you miss the 2:35 bus leaving Hancock and Buena Ventura going to Flintridge and Academy, how long will you have to wait for the next bus?

Or,

ROUTE 5 VISTA GRANDE											
This bus line operates Monday through Saturday providing "local" service to most neighborhoods in the northeast section. Buses run thirty minutes apart during the morning and afternoon rush hours Monday through Friday. Buses run one hour apart at all other times of day and Saturday. No Sunday, holiday or night service.

Using the information in the table, write a brief paragraph summarizing the extent to which parents and teachers agreed or disagreed on the statements about issues pertaining to parental involvement at their school.

- Search through complex displays
- Multiple distractors
- Make high-level text-based inferences
- Use specialized knowledge

Parents and Teachers Evaluate Parental Involvement at Their School

Do you agree or disagree that . . . ?

	Total	Level of School		
		Elementary	Junior High	High School
<i>percent agreeing</i>				
Our school does a good job of encouraging parental involvement in sports, arts, and other nonsubject areas				
Parents	77	76	74	79
Teachers	77	73	77	85

Our school does a good job of encouraging parental involvement in educational areas

Parents	73	82	71	64
Teachers	80	84	78	70

Our school only contacts parents when there is a problem with their child

Parents	55	46	62	63
Teachers	23	18	22	33

Our school does not give parents the opportunity for any meaningful roles

Parents	22	18	22	28
Teachers	8	8	12	7

2009

Conclusions

- Key mechanisms unrecognized
- Mechanisms highly exploitable
- Huge opportunity costs
 - For national policy
 - For clinic practice
 - For vulnerable populations

Thank You
